

- **Rugged Two Electrode Conductivity Sensors**
- **Unique Four Electrode Conductivity Sensors**
- **Versatile Installation Options (Threaded, Quick Change, Retractable)**
- **Specialized High Pressure / High Temperature Options**

Conductivity sensors measure the specific conductance of liquid processes. The specific conductance is directly related to the presence of ionic species and their concentration. Barben Analyzer Technology offers a full range of two electrode and four electrode contacting conductivity sensors for a variety of industrial measurement applications.

Two Electrode Conductivity Sensors

- Designed for pure water and other low to medium conductivity applications.
- Threaded in-line, submersible, and “Hot Tap” retractable product options
- Large range of cell constants to ensure the sensor range properly matches the application.

Four Electrode Conductivity Sensors

- Ideal for medium to high conductivity applications
- A great low cost alternative to toroidal sensor technology
- Additional electrode pair compensates for particulate and scale build-up.
- Threaded in-line, submersible, and “Hot Tap” retractable product options
- Sensor diagnostics (analyzer dependent)

Compatibility with All Major Vendor’s Electronics

- Proven with major vendors of conductivity analyzers (Rosemount, ABB, E&H, Mettler Toledo, Knick)
- Improve your measurement by replacing only the sensor
- Wiring information available

Industrial Mounting Options

- Mounting fittings for sample line installations
- Submersible cleaners and scrubbers
- Ball Valve “Hot Tap” retraction solutions
- Variety of materials for corrosive applications

Liquid Conductivity Two & Four Electrode Sensors

Well known for industrial pH sensor technology; Barben Analyzer Technology also provides a full range of two and four electrode industrial conductivity sensors to support your applications.

Two Electrode Sensor Technology

Two electrode sensors provide a simple, time-proven method for conductivity measurement. Precision machined electrodes of various sizes (cell constants) are matched to the process based on their measurement range. Two electrode sensors are recommended for use in clean (non-coating) applications such as the following:

- **Ultrapure Water**
- **Demineralized / Deionized Water**
- **Reverse Osmosis**
- **Water for Injection**
- **Boiler Water**

Four Electrode Sensor Technology

As the name suggests, four electrode sensors add an additional pair of electrodes to the two electrode sensor design. This second pair of electrodes provides sensor diagnostics which can then be used to compensate the measurement if scale or particulate build-up occur on electrodes. Four electrode conductivity sensors can withstand coating and scale which might otherwise foul a traditional two electrode sensor. Typical applications include the following:

- **Leak Detection**
- **Condensate Return**
- **Salinity**
- **Chemical Concentration**
- **Clean-In-Place**

Sensor Technology (How it works)

Two electrode conductivity measurement is based on the ability to conduct a current between two electrodes. The concentration of ions in the liquid are directly proportional to the conductance of the liquid.

Pros

- Simple, time-proven electrode design
- Industry standard cell constants determine measurement range.
- Works best for clean applications where electrodes do not get fouled.
- High accuracy and repeatability.

Cons

- Susceptible to coating and scale (no compensation)
- Susceptible to corrosion
- No diagnostics

Four electrode sensor designs keep a constant current through two of the electrodes and let the drive voltage change. If fouling occurs then the drive voltage can be increased to compensate the measurement.

Pros

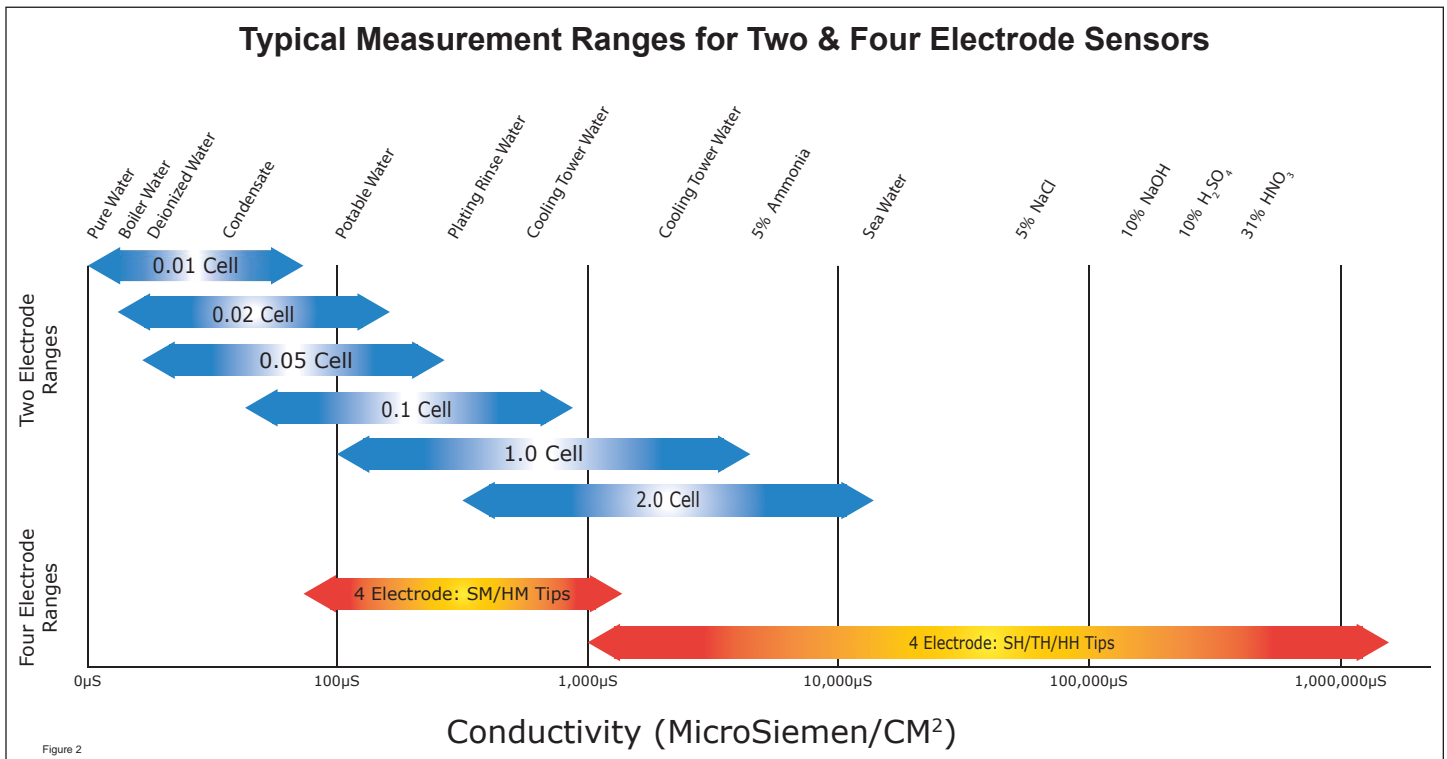

- Compensation for coating and build-up
- Wide measurement range
- Sensor diagnostics if fouling is too great (analyzer dependent)
- No polarization affect

Cons

- Not as accurate as two electrode sensors at low conductivity
- Susceptible to corrosion
- Limited availability of analyzers (ABB, Rosemount, Mettler Toledo, Knick)
- Conductive field can be distorted by pipe walls and flow cells

Figure 1

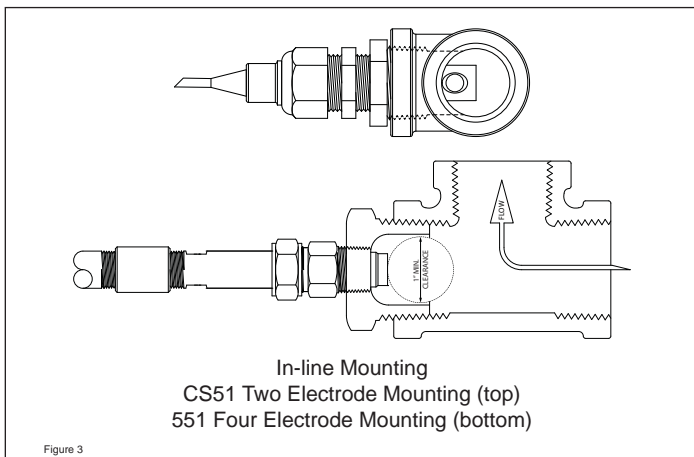

Liquid Conductivity Two & Four Electrode Sensors

Sensor Selection: Mounting

Mounting should be considered as part of sensor selection. Examples of various process mounting configurations are provided below.

In-line Sensor Mounting: In-line installations are common on sample streams from the main process. The sensor may be mounted in a piping tee or a flow cell. The electrodes should be fully exposed to the process flow. Four Electrode Sensors require at least 1 inch of clearance from pipe walls to avoid any distortion of reading. Isolation valves should be upstream / downstream of sensor for removal.

Hot Tap Sensor Mounting: Hot Tap refers to the ability to remove the sensor from the process while under pressure. A ball valve is used to isolate the sensor for removal.

Submersible Mounting: This mounting style is used when the sensor is installed in a tank, or open channel. The sensor must be mounted on a "dip tube" which is the hardware to submerge the sensor in the application.

Liquid Conductivity Two & Four Electrode Sensors

Model CS10 / CS51

Two Electrode Threaded In-line, Submersible

The threaded CS10 / CS51 products are ideal for clean water sample stream applications using the NPT process connection. The same NPT adapter fitting can be reversed to mount the sensor in submersible installations.

CS10 with 0.01 Electrode

Wetted Material

- Electrodes 316 Stainless Steel
- Insulator Teflon
- Seals EPR
- Mounting Polypropylene or 316 Stainless

Temperature Compensation

- PT100 RTD
- PT1000 RTD
- 8550 Ohm (Honeywell)

Pressure / Temperature Ratings

Sensor Design	Max. Pressure / Temperature
Polypropylene Adapter	100 PSIG (690 kPa) @ 212°F (100°C)
316 Stainless Adapter	200 PSIG (1380 kPa) @ 248°F (120°C)

Liquid Conductivity Two & Four Electrode Sensors

Model CS41

Two Electrode High Pressure Threaded In-line

The CS41 Two Electrode Conductivity Sensor is specifically designed to handle the high pressure requirements found in boiler water measurement. It uses a rugged, explosionproof junction box with a high temp terminal strip for internal wiring.

Wetted Material

- Electrodes 316 Stainless Steel
- Insulator PEEK
- Seals EPR (dual o-ring)
- Mounting 316 Stainless

Pressure / Temperature Ratings

Sensor Design	Max. Pressure / Temperature
316 Stainless	400 PSIG (2758 kPa) @ 212°F (100°C) 250 PSIG (1724 kPa) @ 401°F (205°C)

Liquid Conductivity Two & Four Electrode Sensors

Model CS40 Two Electrode Hot Tap Retractable

For applications where a sample line is not present the CS40 Two Electrode Sensor provides an easy method to remove and isolate the sensor for cleaning and calibration.

Wetted Material

- Electrodes 316 Stainless Steel
- Insulator Kel-F PCTEF (std), PEEK (high temp)
- Seals EPDM / Viton / Buna-N
- Hardware 316 Stainless

Pressure / Temperature Ratings

Sensor Design	Max. Pressure / Temperature
Standard Temp	100 PSIG (689 kPa) @ 302°F (150°C)
High Temp	250 PSIG (1724 kPa) @ 401°F (205°C)

Temperature Compensation

- PT100 RTD
- PT1000 RTD
- 8550 Ohm (Honeywell)

Liquid Conductivity Two & Four Electrode Sensors

Model 551 / 546 / 547

Four Electrode In-line, Hot Tap, and Submersible

Barben's four electrode conductivity sensors use the same housing and accessories as our pH products.

Wetted Material

- Electrodes 316 Stainless, Titanium Gr2, Hastelloy C
- Insulator PEEK
- Seals EPDM / Viton
- Hardware *(see accessories guide for hardware options)*

547 Cartridge style Four Electrode Sensor

Temperature Compensation

- PT100 RTD
- PT1000 RTD
- 3K Ohm RTD (Balco)

Pressure / Temperature Ratings

Sensor Type	Installation Type		
	Threaded Nut Lock (plastic / metal body with hand nut only)	Threaded Nut Lock (metal body & metal hex nut only)	Flanged / Threaded Nut Lock (plastic body & metal hex nut only)
